

2)

$V = 40$
interface state well-localised to left of the impurity potential.

$V = 41$
energy of interface state approaches the bulk band edge, and interface state broadens.

$V = 41.5$
interface state broadening reaches $x=0$.

$V = 41.7$
interface state hybridizes with bulk state, and forms a maximum that gradually moves away from the interface.
